"Problem of Dry Winds in Volga Region," P. A. Krylov,
Combined Sci Exped. in Field-Protecting Afforestation,
Acad Sci USSR

"Iz Ak Nauk SSSR, Ser Fiz" No 5, pp 76-85

Describes results of actinometric measurements, performed during the summer of 1951 in the Caspian region. Results show that strong absorption of solar radiation should be ascribed to dust in the atm. Comparison of these deductions with other meteorological data a permit explanation of the mechanism of dry winds. Received 17 Mar 52.

Author : Krylov, P. A.

Title : Michelson actinometer as an absolute instrument

Periodical : Izv. AN SSSR, Ser. geofiz., Nov-Dec 1955, 552-556

Abstract : The author gives the historical background of the Michelson actinometer. He states that according to experimental indications the Michelson actinometer reconstructed into an absolute actinometer preserves completely its outstanding qualities and that all the quantities needed for computing the conversion multiplier can be determined with great accuracy for each model of the instrument. He claims that such an instrument should be called a bimetallic pyrheliometer, and that comparison of its readings with the readings of pyrheliometers (compensation and water-jet types) should be one of the stages in its further development. Ten references: e.g. V. G. Fesenkov, "Certain considerations on the optical properties of the atmosphere, Astron. zhur., No 4, 1945.

AUTHOR: Krylov, P. A.

49-10-5/10

TITLE: On work relating to the solar constant. (Iz rabot po solnechnoy postoyannoy).

PERIODICAL: Izvestiya Akademii Nauk SSSR, Seriya Geofizicheskaya, 1957, No.10, pp.1249-1261 (USSR) + 1 plate.

ABSTRACT: This is essentially a review paper quoting predominantly non-Russian, particularly American, sources. The author concludes that until the value of the solar constant is measured from points beyond the limits of the Earth's atmosphere, or at least in the very high layers of the atmosphere, it can be assumed that the most reliable value of the solar constant is 1.940 cal/cm²/min. There are 3 tables, 4 figures and 18 references, 6 of which are Slavic.

AUTHOR: Krylov, P. A. ✓
TITLE: Bimetallic Pyrheliometer 1/2E
PERIODICAL: Izvestiya Akademii Nauk SSSR, Seriya geofizicheskaya,
1960, No.7, pp.1086-1090

TEXT: The present paper reports a modification of V. A. Mikhel'son's actinometer (Refs.1,5). The modification consists in the replacement of the single bimetallic receiver strip by a composite one consisting of two such strips (see Fig.1). A list of numerical characteristics of a group of such pyrheliometers is given in addition to a very detailed discussion of the errors involved. One of these pyrheliometers was compared with an Angstrom pyrheliometer and the discrepancy between the conversion factors for the two instruments was found to be approximately 0.3%. The actual values were 0.02125 cal/cm²·min and 0.02131 cal/cm²·min. It is suggested that a large scale comparison of the bimetallic pyrheliometer with Swedish and American instruments would be very desirable. There are 3 figures and 5 references: 4 Soviet (1 in translation from English) and 1 English. Card 1/2

TITLE: On spark chambers possessing a large memory

SOURCE: Pribory i tekhnika eksperimenta, no. 2, 1966, 43-48

TOPIC TAGS: cosmic ray, cosmic ray telescope, cosmic ray burst, cosmic ray chamber, cosmic ray spark chamber, cosmic ray chamber memory

ABSTRACT: The paper discusses air-argon cosmic ray telescope chambers activated by delayed spark discharges controlled by multiple Geiger counters via coincidence and delay circuitry. The chamber has been improved by the introduction of 2 - 3 dielectric layers (2 mm thick glass plates) and ethyl alcohol vapor (air 25%, Argon 70%, alcohol 5%). Aluminum foil electrodes were spaced 5 - 7 mm apart, and the chamber was initiated by 12 - 14 kv impulses with a controllable delay from 2 microseconds to 2 milliseconds. Bright sparks, situated near the particle trajectory depicted the passage. The dielectric layers uncoupled the individual passages of the chamber. The dependence of spark trajectory localization precision is discussed. A histogram of trajectory deviation from a straight line is given. Besides the air/argon chamber filling, the oxygen/argon/ethyl alcohol mixture was studied as to its effects on the precision of trajectory tracing and on chamber memory. It was found that memory and precision are determi-

Card 1/2

UDC: 539.1.073

ACC NR: AP6013491

ned by the oxygen content, that is the memory and precision remain essentially the same at a given oxygen content in the working mixture. A theory of chamber effectiveness in the registration of single particles, with particular regard to the influence of high voltage impulse delay was developed & discussed in conjunction with experimental results. It is concluded that the negative ions which initiate the spark discharge are located in a small region adjacent to the negative electrode. Effectiveness in the spark registration of multiple particle trajectories decreased with the increase of delay time. The introduction of dielectric layers markedly increased the effectiveness of the chamber in shower registration. The authors thank A.I. Alikhanyan for his attention to this work and S.S. Kulikova and V.A. Mishchenkov for a substantial assistance in this effort. Orig. art. has: 5 figures, 3 formulas and 1 table.

SEARCHED
SUBJECT: USSR/New Scientific Center in Siberia

25-6-1/46

AUTHOR: Krylov, S.

TITLE: New Horizons (Novyye gorizonty)

PERIODICAL: Nauka i Zhizn' - June 1957, # 6, pp 1-2 (USSR)

ABSTRACT: The USSR is at present the second largest industrial producer in the world. Its aim is to reach and surpass the the technical and economic achievements of all other countries. In connection with the new control system over industrial production and construction recently outlined by N.S. Khrushchev, the Communist Party had initiated open discussions on the ways and means of making the most rapid progress. In order to build up new industries and exploit natural resources, it was suggested that new research installations should be established all over the vast eastern territory with a large scientific center in Siberia. Thus a closer co-operation between science and the new industrial bases would be assured. Professors have hailed this idea with enthusiasm and expressed their readiness to settle down in Siberia, where their skill and experience is mostly needed.

"Science and Life" (Nauka i Zhittyia)

PERIODICAL:

Nauka i Zhizn', 1957, # 8, pp 61-62 (USSR)

ABSTRACT:

The purpose of the journal, "Nauka i Zhittyia", organ of the Society for the Propagation of Political and Scientific Knowledge of the Ukrainian SSR, is to inform the broad masses of recent technical and scientific achievements and at the same time to outline the cultural life of the Republic. The publication of articles written by leading scientists, such as A.V. Palladin, President of the Ukrainian Academy of Sciences, insures the high standard of this journal, which has been published now for the last seven years. During this time, its quality has been improved with regard to the choice of articles and authors. Nevertheless, there is still a series of insufficiencies to be found in the published articles, such as a lack of convincing arguments with regard to religious questions, or an insufficiency in the description of important discoveries. As far as the illustrations and the cover are concerned, too much uniformity is quite obvious. A more ingenious

PERIODICAL: Nauka i Zhizn', 1957, # 10, pp 9-10 (USSR)

ABSTRACT: The increasing number of atomic explosions represents a grave danger for all human beings, especially the fallout of strontium-90 which comes down to the earth together with precipitations and has a negative effect on the biosphere. The Soviet scientist and oncologist N.N. Petrov proved the destructive influence of radioactive elements on the organism by experiments with animals. The physicist Frederic Joliot-Curie claims that if nuclear tests are not stopped in the near future the percentage of strontium in human organism will be such that malignant tumors, leucocytosis and other dangerous diseases will be wide-spread. Scientists of international reputation warned against these disastrous consequences, for instance, 2,200 American scientists protested against the atomic arms race and the policy pursued by their Administration.

Recently, scientists of ten nations met in Paguoshe, Canada. The purpose of this conference was, according to a

Card 1/2

member of the Russian delegation, Academician A.V. Topchiyev not only the joint appeal to ban nuclear weapons but at the same time to find a common formula to bring about an easing of tension all over the world. A permanent committee was established with the aim of coordinating the efforts of all scientists to prevent a new war and to join their forces for a peaceful use of atomic energy.

TITLE: Frequency spectrum of short-period fluctuations of sea-water temperature

SOURCE: Meteorologiya i hidrologiya, no. 8, 1966, 42-45

TOPIC TAGS: temperature^{measurement}, platinum resistance thermometer, temperature gradient, oscillation period, active water layer, ocean temperature/Baltic Sea

ABSTRACT: During 1963 and 1964 temperature-oscillation observations in the Baltic Sea were performed with platinum resistance thermometers which were dipped on fifteen horizontal levels in a layer of the chosen thickness at a distance of 2 km from the shore. Temperature oscillations were recorded automatically on the shore. The amplitude of temperature oscillations was great; for instance, one day at a depth of 13 m the amplitude was 2.6°C in a period of 3.5 min, and at a depth of 5 m the amplitude was 2.3°C in a period 3.0. These samples related to a period when the temperature gradients at a fixed point were 1.0–1.5°C per meter. The temperature oscillation period is the most stable parameter, which, for the most part, lasts three minutes. The increase of temperature gradient is associated with a decrease of the oscillation period. A table in the original article shows the comparison of oscillation periods in the Baltic Sea with those of the California coast. The period of

Card 1/2

UDC: 551.463.6

ACC NR: AP6030726

oscillation in the Norwegian Sea was found to be 20 min which indicates that the deep water far from shore the oscillation period increases. Analysis of oscillation of short periods makes it possible to conclude that 1) the active layer of the sea water has no regular short-period temperature oscillations; 2) short-period temperature oscillations occur when the layer of temperature jump exists; 3) the oscillation period depends upon the temperature gradient. Orig. art. has: 3 figures, 2 tables, and 4 formulas.

AUTHOR: Gurskiy, A.F., Engineer, and Krylov, S.M., Candidate of Technical Science.

TITLE: Joints of Assembled Reinforced Concrete Columns Without Coupling Plates for Industrial Constructions. (Styki sbornykh zhelezobetonykh kolonn bez tsentriruyushchikh prokladok dlya promyshlennogo stroitel'stva.)

PERIODICAL: Beton i zhelezobeton, 1957, No. 1, pp. 19-23, (U.S.S.R.)

ABSTRACT: The method devised by engineer A.F. Gurskiy in simplifying connections with precast columns for multistorey structures omits steel coupling plates and bolts. It relies on the direct contact of the concrete surfaces (with or without steel collars.) This method is more suitable for columns with large cross sections. Different variations of this method were developed: 1) A joint without coupling plates constructed to transmit the pressure directly from concrete to concrete to counteract bending moments. Connection is provided by extended corner reinforcing bars which are welded together. In the factories the column is cast in a horizontal position, simultaneously for all the required number of floors.

Card 1/3

97 - 1 - 5/10

TITLE: Joints of Assembled Reinforced Concrete Columns Without Coupling Plates for Industrial Constructions. (Styki sbornykh zhelezobetonnykh kolonn bes tsentriruyushchikh prokladok dlya promyshlennogo stroitel'stva.)

Steel plates are inserted in the joints (10 - 12 mm thick) which are removed with the casing. Method 2) A steel base plate is welded to a sleeve which in turn is welded to the main reinforcement. Columns are joined by welding the sleeve of one column to the base plate of the second column. Method 3) The reinforcement is inserted into the casing (including the steel plates) after which the concreting of all beams proceeds simultaneously. The metal plates are removed after 12 - 24 hours. The joint is obtained by welding the sleeves together. The secondary reinforcement was calculated according to A.P. Kuznetsov's formula.

UHME carried out tests on the above joints. Concrete grade 200 and steels T-1 to T-5 were used. Test conditions and eccentric loading tests were given. The joints made according to the above method proved to be as strong as those which were cast monolithically. It is possible to form joints at any selected column height. Calculation of construction was possible on the base of monolithic frame structures, omitting the effects of the joints. The method

simplifies the process of jointing as well as that of assembly. The process can be carried out in any type of weather because of the elimination of the wet processes. It can be applied to any type of construction, e.g. beams, arches, frames, etc.

There are 4 sets of diagrams, 2 photographs, 2 graphs and 2 tables.

AUTHORS: Gurskiy, A. F. (Engineer) and Krylov, S. M. (Candidate of Technical Sciences)

TITLE: The Rigidity and Strength of Joints of Pre-cast Reinforced Concrete Columns. (O zhestkosti i prochnosti stykov sbornykh zhelezobetonykh kolonn).

PERIODICAL: Beton i Zhelezobeton, 1957, Nr. 9, pp.351-355 (USSR).

ABSTRACT: According to investigations carried out by the Academy of Architecture of USSR, the joints of pre-cast reinforced concrete columns with central pads, and also joints grouted in cement, tend to settle. V. N. Gornov, Candidate of Technical Science, in an article entitled "Investigations into the Rigidity and Strength of Industrially Manufactured Housing Units" (Ref.1), concluded that settling of such joints amounts to 0.85-2 mm under superimposed load, and in the moment of breaking to 1.7-4 mm. N. V. Morozov and B. N. Zivadivker, Candidates of Technical Science (Ref.2) state that pre-cast reinforced concrete columns jointed by high quality cement, when under superimposed load show compression of 0.8-2 mm, and during breaking load 1.7-4 mm. Calculations are given for defining the bending moment of a frame, at a joint, and Fig.1 shows the effect of the
